## Abstract

MongoDB is a [NoSQL] database which uses [BSON] to store and load information in a database. With the mongodb package a shell program called mongo is available to give instructions to a mongodb server.

To work with data on the server from within a program a driver is needed. There are drivers for many program languages. This document introduces a driver for the Perl6 language. In the perl6 ecosystem, which might grow into a cpan like system later, there are two packages needed to work with the driver. These are [MongoDB] and BSON.
